Q.1. Consider a program for determining the previous date. Its input is triple of day, month and year with the following ranges $1 \leq \text{month} \leq 12$, $1 \leq \text{day} \leq 31$, $1900 \leq \text{year} \leq 2015$. The possible output dates would be previous date or invalid date. Design the equivalence class test cases?

1) Equivalence Class Partitioning (EP):

Equivalence partitioning divides the input domain into several classes that are expected to behave similarly

Valid Equivalence Classes:

Day	$1 \leq \text{day} \leq 31$
Month	$1 \leq \text{month} \leq 12$
Year	$(1900 \leq \text{year} \leq 2015)$

Invalid Equivalence Classes:

Day	$1 > \text{day} \text{ or } \text{day} > 31$
Month	$1 > \text{month} \text{ or } \text{month} > 12$
Year	$1900 > \text{year} \text{ or } \text{year} > 2015$

2. Boundary Value Analysis (BV):

BV tests values at the boundaries between partitions.

Boundaries for Day:

Minimum value:1

Maximum value:31

Boundaries for Month:

Minimum value:1

Maximum value:12

Boundaries for Year:

Minimum Value:1900

Maximum Value:2015

3. Test Cases:

Input Data	Expected Outcome	Type
2,5,2000	Previous date: 1/5/2000	EP
1,3,2015	Previous date: 28/2/2015	EP
32,5,2000	Error	EP
15,13,2000	Error	EP
15,10,1899	Error	EP
1,1,1900	Previous date:31/12/1899	BV
1,2,1900	Previous date:31/1/1900	BV
1,1,2015	Previous date: 31/12/2014	BV

31/12/2015	Previous date: 30/12/2015	BV
------------	------------------------------	----

Code

```
#include <iostream>

#include <vector>

#include <string>

using namespace std;

// Function to check if a year is a leap year
bool isLeapYear(int year) {

    return (year % 4 == 0 && (year % 100 != 0 || year % 400 == 0));

}

// Function to get the number of days in a given month of a given year
int daysInMonth(int month, int year) {

    vector<int> days = {31, 28, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31};

    if (month == 2 && isLeapYear(year)) {

        return 29;

    }
```

```

    }

    return days[month - 1];
}

// Function to calculate the previous date
string previousDate(int day, int month, int year) {

    if (!(1 <= month && month <= 12 && 1900 <= year && year <= 2015)) {

        return "Invalid date";

    }

    int maxDays = daysInMonth(month, year);

    if (!(1 <= day && day <= maxDays)) {

        return "Invalid date";

    }

    if (day > 1) {

        return to_string(day - 1) + ", " + to_string(month) + ", " +
to_string(year);

    } else if (month > 1) {

        int prevMonth = month - 1;

        return to_string(daysInMonth(prevMonth, year)) + ", " +
to_string(prevMonth) + ", " + to_string(year);

    } else {

        return "31, 12, " + to_string(year - 1);
    }
}

```

```

    }

}

// Function to run the test cases

void runTests() {

    vector<pair<vector<int>, string>> testCases = {

        {{2, 5, 2000}, "1, 5, 2000"},

        {{1, 3, 2015}, "28, 2, 2015"},

        {{32, 5, 2005}, "Invalid date"},

        {{14, 22, 2001}, "Invalid date"},

        {{1, 3, 1801}, "Invalid date"},

        {{1, 1, 1900}, "31, 12, 1899"},

        {{1, 2, 1900}, "31, 1, 1900"},

        {{1, 1, 2015}, "31, 12, 2014"},

        {{31, 12, 2015}, "30, 12, 2015"}

    };

    for (int i = 0; i < testCases.size(); i++) {

        vector<int> input = testCases[i].first;

        string expected = testCases[i].second;

        string result = previousDate(input[0], input[1], input[2]);

        cout << "Test " << i + 1 << " " << (result == expected ? "PASS" :
"FAIL") << endl;
    }
}

```

```
        cout << "    Input: " << input[0] << ", " << input[1] << ", " <<
input[2] << endl;

        cout << "    Expected: " << expected << endl;

        cout << "    Actual: " << result << endl;

        cout << endl;

    }

}

int main() {

    runTests();

    return 0;

}
```

Q-2

P1:

```
int linearSearch(int v, int a[]){  
  
    int i = 0;  
  
    while (i < a.length){  
  
        if (a[i] == v)  
  
            return(i);  
  
        i++;  
  
    }  
  
    return (-1);  
  
}
```

1. Equivalence Class Partitioning:

We can divide the inputs into valid and invalid equivalence classes.

Valid Equivalence Classes:

- v is present in the array a.
- v is not present in the array a.
- The array a, contains one or more elements.

Invalid Equivalence Classes:

- The array a is empty.

2. Boundary Value Analysis:

Test boundary values for the size of the array a:

- Empty array (a with size 0).
- Array with one element.
- Array with two elements (minimum non-trivial size).
- Array with a large number of elements.

Boundary for the element v to be found:

- v is at the first index (index 0).
- v is at the last index (index a.length-1).

3. Test Cases

Input Data	Expected Outcome	Type
[1, 2, 3, 4, 5], 3	Return index: 2	EP
[10, 20, 30,40], 10	Return index: 10	EP
[9, 8, 7, 6],5	Error (Not Found)	EP
[], 5	Error (Array is empty)	EP

[3], 3	Return index: 0	BV
[1, 2], 2	Return index: 1	BV
[4, 5, 6], 6	Return index: 2	BV
[10, 20, 30, 40,..., 1000], 1000	Return index: 999	BV
[10, 20, 30, 40,..., 1000], 1	Error (Not Found)	BV

P2:

```
int countItem(int v, int a[]){  
  
    int count = 0;  
  
    for (int i = 0; i < a.length; i++){  
  
        if (a[i] == v) Count++;  
  
    }  
  
    return (count);  
  
}
```

1. Equivalence Class Partitioning:

We can divide the inputs into valid and invalid equivalence classes.

Valid Equivalence Classes:

- v appears one or more times in the array a.
- V does not appear in the array a.
- The array contains one or more elements.

Invalid Equivalence Classes:

- The Array a is empty.

2. Boundary Value Analysis:

Test boundary values for the size of the array a:

- Empty Array(a with size 0).
- Array With One Element.

- Array With Two Elements.
- Array With Large Number of elements.

Boundary For the element v Occurrence:

- v appears once.
- v appears multiple times.
- v does not appear at all.

Test Cases :

Input Data	Expected Outcome	Type
[1, 2, 3, 4, 5], 3	Return count: 1	EP
[10, 20, 30,40], 10	Return count: 1	EP
[9, 8, 7, 6],5	Error (Not Found)	EP
[], 5	Error (Array is empty)	EP
[3], 3	Return count: 1	BV

[1, 2], 2	Return count: 1	BV
[4, 5, 6], 6	Return count: 3	BV
[10, 20, 30, 40,..., 1000], 1000	Return count: 1	BV
[10, 20, 30, 40,..., 1000], 1	Error (Not Found)	BV

P3:

```
int binarySearch(int v, int a[]){  
  
    int low,mid,high;  
  
    low = 0;  
  
    high = a.length-1;  
  
    while (low<= high){  
  
        mid = (low+high)/2;  
  
        if (v == a[mid]) return (mid);  
  
        else if (v < a[mid])    high= mid-1;  
  
        Else  low = mid+1;  
  
    }  
  
    return(-1);  
  
}
```

1. Equivalence Class Partitioning:

We can divide the inputs into valid and invalid equivalence classes.

Valid Equivalence Classes:

- v is present in the array a.
- v is not present in the array a.
- The array contains one or more elements, and is sorted.

Invalid Equivalence Classes:

- The array a is empty.
- The array a is unsorted.

2. Boundary Value Analysis:

Test boundary values for the size of the array a:

- Empty array (a with size 0).
- Array with one element.
- Array with two elements.
- Array with a large number of elements.

Boundary for the element v to be found:

- v is at the first index (index 0).
- v is at the last index (index a.length-1).
- v is not in the array at all.

Test Cases:

Input Data	Expected Outcome	Type
[1, 2, 3, 4, 5], 3	Return index: 2	EP
[10, 20, 30, 40], 10	Return index: 10	EP

[9, 8, 7, 6],5	Error (Array is Unsorted)	EP
[5, 10, 15, 20], 25	Error (Not Found)	EP
[], 5	Error (Array is empty)	EP
[3], 3	Return index: 0	BV
[1, 2], 2	Return index: 1	BV
[4, 5, 6], 6	Return index: 2	BV
[10, 20, 30, 40,..., 1000], 1000	Return index: 999	BV
[10, 20, 30, 40,..., 1000], 1	Error (Not Found)	BV

P4:

```
final int EQUILATERAL = 0;

final int ISOSCELES = 1;

final int SCALENE = 2;

final int INVALID = 3;

int triangle(int a, int b, int c){

if (a >= b+c || b >= a+c || c >= a+b) return (INVALID);

if (a == b && b == c) return (EQUILATERAL);

if (a == b || a == c || b == c) return (ISOSCELES);

return (SCALENE);

}
```

1. Equivalence Class Partitioning:

We can divide the inputs into valid and invalid equivalence classes.

Valid Equivalence Classes:

- Equilateral triangle (all three sides are equal).
- Isosceles triangle (two sides are equal).
- Scalene triangle (all sides are different).

Invalid Equivalence Classes:

- The side lengths do not satisfy the triangle inequality:
 - $a \geq b + c$
 - $b \geq a + c$
 - $c \geq a + b$
- One or more sides are non-positive (i.e., $a \leq 0$, $b \leq 0$, $c \leq 0$).

2. Boundary Value Analysis:

Test boundary values for the lengths of the sides of the triangle:

- Minimal positive length (1).
- Equal side lengths for equilateral and isosceles.
- Slight variations in side lengths for scalene and invalid cases.
- Triangle inequality boundary conditions.

3. Test Cases:

Input Data	Expected Outcome	Type
(3, 3, 3)	Return: Equilateral(0)	EP
(5, 5, 9)	Return: Isosceles(1)	EP

(4, 5, 6)	Return: Scalene(2)	EP
(10, 5, 4)	Error: (Triangular Inequality) (3)	EP
(0, 5, 5)	Error: (Non-positive Side Value) (3)	EP
(1, 1, 1)	Return: Equilateral(0)	BV
(2, 2, 3)	Return: Isosceles(1)	BV
(3, 4, 5)	Return: Scalene(2)	BV
(1, 2, 3)	Error: (Triangular Inequality) (3)	BV
(-2, 2, 3)	Error: (Non-positive Side Value) (3)	BV

P5:

```
public static boolean prefix(Strings1,Strings2){  
  
if(s1.length()>s2.length())Return False;  
  
for(int i=0; i<s1.length(); i++){  
  
    if(s1.charAt(i)!=s2.charAt(i))return false;  
  
}  
  
return true;  
  
}
```

1. Equivalence Class Partitioning:

We can divide the inputs into valid and invalid equivalence classes.

Valid Equivalence Classes:

- S1 is a valid prefix of s2.
- S1 is not a prefix of s2.
- S1 is an empty string (an empty string is a prefix of any string).
- S1 is longer than s2.

2. Boundary Value Analysis:

Test boundary values for the lengths of s1 and s2:

- s1 and s2 are both empty strings.
- s1 is an empty string and s2 is non-empty.
- s1 has one character and s2 has the same character at the start.

- s1 and s2 have the same length and are equal.
- s1 is longer than s2.

3. Test Cases:

Input Data	Expected Outcome	Type
("pre", "prefix")	Return: true	EP
("fix", "prefix")	Return: false	EP
("longer", "short")	Return: false	EP
("prefix", "prefix")	Return: true	EP
("a", "abc")	Return: true	BV
("abc", "abc")	Return: true	Bv
("abcdef", "abc")	Return: false	BV
("abc", "abx")	Return: False	BV

P6:

Consider again the triangle classification program (P4) with a slightly different specification: The program reads floating values from the standard input. The three values A, B, and C are interpreted as representing the lengths of the sides of a triangle. The program then prints a message to the standard output that states whether the triangle, if it can be formed, is scalene, isosceles, equilateral, or right angled.

a) Identify the equivalence classes for the system:

Equivalence Classes:

We can identify different equivalence classes based on the properties of a triangle.

Valid Equivalence Classes:

- Equilateral Triangle: All sides are equal ($A = B = C$).
- Isosceles Triangle: Two sides are equal ($A = B$ or $A = C$ or $B = C$).
- Scalene Triangle: No sides are equal ($A \neq B \neq C$).
- Right-Angled Triangle: The sides satisfy the Pythagorean theorem ($A^2 + B^2 = C^2$).

Invalid Equivalence Classes:

- The sides do not satisfy the triangle inequality ($A + B \leq C$ or $A + C \leq B$ or $B + C \leq A$).
- One or more sides are non-positive ($A \leq 0$ or $B \leq 0$ or $C \leq 0$).

b) Identify test cases to cover the identified equivalence classes.

Also, explicitly mention which test case would cover which equivalence class.

Test Cases:

Input Data	Expected Outcome	Equivalence Class
(3.0, 3.0, 3.0)	Equilateral	Equilateral($A=B=C$)
(6.0, 6.0, 8.0)	Isosceles	Isosceles($A=B, A \neq C$)
(3.0, 4.0, 6.0)	Scalene	Scalene($A \neq B \neq C$)
(3.0, 4.0, 5.0)	Right Angled	Right Angled($A^2 + B^2 = C^2$)
(1.0, 2.0, 3.0)	Error	Invalid
(0.0, 4.0, 5.0)	Error	Invalid
(-1.1, 2.0, 2.0)	Error	Invalid
(4.0, 4.0, 7.0)	Error	Invalid

c) For the boundary condition $A + B > C$ case (scalene triangle), identify test cases to verify the boundary.

This condition ensures that the sum of two sides is greater than the third.

Test Case 1:

- Input: (3.0, 4.0, 7.0) (Boundary value where $A + B = C$)
- Expected Outcome: Invalid Triangle (fails triangle inequality).

Test Case 2:

- Input: (4.0, 4.0, 7.0) (Boundary value where $A + B = C$)
- Expected Outcome: Isosceles Triangle.

d) For the boundary condition $A = C$ case (isosceles triangle), identify test cases to verify the boundary.

This condition checks whether two sides of the triangle are equal.

Test Case:

- Input: (5.0, 7.0, 5.0) (Two sides are equal at the boundary).
- Expected Outcome: Isosceles Triangle.

e) For the boundary condition $A = B = C$ case (equilateral triangle), identify test cases to verify the boundary.

This checks for cases where all three sides are equal.

Test Case 1:

- Input: (6.0, 6.0, 6.0) (All sides are equal at the boundary).
- Expected Outcome: Equilateral Triangle.

Test Case 2:

- Input: (7.0, 6.0, 6.0).
- Expected Outcome: Not an Equilateral Triangle.

f) For the boundary condition $A^2 + B^2 = C^2$ case (right-angle triangle), identify test cases to verify the boundary.

This checks if the triangle satisfies the Pythagorean theorem.

Test Case:

- Input: (3.0, 4.0, 5.0) (Classic Pythagorean triplet).
- Expected Outcome: Right-Angled Triangle.

g) For the non-triangle case, identify test cases to explore the boundary.

This tests the triangle inequality where the sum of two sides is not greater than the third side.

Test Case:

- Input: (1.0, 2.0, 3.0) (Boundary value where $A + B = C$).
- Expected Outcome: Invalid Triangle.

h) For non-positive input, identify test points.

This tests cases where one or more sides are non-positive.

Test Case 1:

- Input: (0.0, 3.0, 4.0) (Zero side length).
- Expected Outcome: Invalid Triangle.

Test Case 2:

- Input: (-1.0, 3.0, 3.0) (Negative side length).
- Expected Outcome: Invalid Triangle
